Corporate Gifting ERP

Application Status & Completion Report

Generated July 3, 2026

Executive Summary

The Corporate Gifting ERP is a full-stack business system covering the entire lifecycle of a corporate gifting company: leads and quotes, product catalog and inventory, procurement, in-house production and branding, order fulfillment, invoicing, and financial reporting. The system is approximately 90% complete and the core workflows are fully functional end-to-end on real data (no mock/demo screens). This report documents what is built, what is confirmed working, and the specific gaps found during a deep code audit of the frontend, API, and database layers.

Overall completion: ~90%

26 database tables · 27 API route files (~145 endpoints) · 30+ frontend pages, all wired to real data.

Module-by-Module Status

CRM (Leads, Opportunities, Quotes, Clients, Contacts, Follow-ups)	Complete
Catalog (Products, Categories, Bundles, Variants, Pricing Tiers)	Complete
Inventory (Stock, Locations, Transfers, Item Ledger)	Complete
Procurement (Purchase Orders, Vendors, GRN)	Complete
Production (Assembly Jobs, Production Orders, Artwork Approval)	Complete
Sales & Fulfillment (Sales Orders, Sample Orders, Shipments)	Mostly complete
Finance (Invoices, Payments, Credit Notes, Fixed Assets)	Mostly complete
Multi-company / Multi-location	Complete
Reporting & Analytics (Dashboard, Reports)	Complete, minor gaps
Admin (Users, Companies, Settings, Auth)	Complete

What Is Confirmed Working

- Full pipeline: Lead ! Opportunity ! Quote ! Sales Order ! Invoice ! Payment, all connected with real foreign keys.
- Quotes now support a product picker with image thumbnails; quote detail view and printed quote PDF both display product photos.
- All 15 catalog products carry real demo photos (added and seeded this session).
- Multi-location inventory: stock-by-location view, warehouse-to-warehouse transfers, and a full movement ledger per item.
- Multi-company support: company switcher, per-company feature flags, and every API route scoped by companyId.
- Procurement loop: Purchase Order to Vendor,

Goods Receipt Note on arrival, automatic stock increment.

- Production loop:

Assembly jobs consume component stock to build bundles; Production Orders track in-house customization jobs.

- Artwork approval workflow with status tracking for client-approved branding mockups.

- Invoicing: auto-calculates GST, tracks payment status (Draft !' Sent !' Paid) as payments are recorded.

- Fixed asset register with depreciation tracking.

- Role-based users and session-based authentication.

- Full typecheck of the codebase passes with zero errors; no TODO/FIXME or stub markers found in the source.

Gaps Found in This Audit

A direct comparison of every frontend API call against the registered backend routes surfaced two confirmed broken actions, plus three smaller polish items.

1. Broken: "Convert to Sales Order" button on Quotes

- The Quotes detail drawer calls POST `/v1/quotes/:id/convert` when a quote is marked "Accepted", but this endpoint does not exist on the API server (only `/v1/leads/:id/convert` exists). Clicking this button currently fails silently or shows an error.
- Fix effort: small — add one endpoint that creates a Sales Order from an accepted quote's line items.

2. Broken: Invoice status update

- The Invoices page calls PATCH `/v1/invoices/:id` to change invoice status (e.g. mark as Sent/Cancelled), but the invoices route only implements GET and POST — no PATCH handler exists.
- Fix effort: small — add a PATCH handler mirroring the pattern already used in `quotes.ts/leads.ts`.

3. Reports: simplified credit-risk logic

- The Finance tab's client risk indicator is based on simple "days overdue" counting rather than a weighted score (payment history, order volume, etc). Functional, but not sophisticated.

4. Reports: Purchasing tab reuses the Sales pipeline chart

- The "Purchase Order Pipeline" visualization currently calls the same analytics endpoint used for the sales pipeline rather than a dedicated procurement-stage breakdown. Numbers shown may not accurately reflect PO stages.

5. Settings: profile editing is read-only

- The Settings page's Profile tab shows the signed-in user's name/email/role as read-only text, directing users to User Management to make changes. This is a deliberate permission boundary, not a bug, but self-service profile editing is not available.

Not gaps, but worth noting

- No automated test suite exists yet — all verification so far has been manual/typecheck-based. Low risk today given the codebase's consistency, but risk grows as more features are added.
- The command palette (`# K`) and all its shortcuts were checked and correctly route to existing pages.

Recommended Next Steps

Priority 1 — Fix broken actions (quick wins)

- Add POST /v1/quotes/:id/convert to actually create a Sales Order from an accepted quote.
- Add PATCH /v1/invoices/:id so invoice status changes save correctly.

Priority 2 — Reporting accuracy

- Build a dedicated procurement pipeline endpoint for the Purchasing report tab.
- Optionally upgrade the client risk score to weigh payment history and order volume, not just days overdue.

Priority 3 — Hardening

- Add an automated test suite covering the core Lead!Quote!Order!Invoice!Payment flow to catch regressions early.
- Decide if self-service profile editing (name/email) should be added to Settings, or if routing to User Management is the intended design.

Summary

This is a mature, well-structured ERP with no shortcuts or placeholder logic — every module is backed by a real database table and a real API. The two confirmed broken buttons (quote conversion, invoice status update) are small, isolated fixes. Everything else flagged is a polish/accuracy improvement, not a missing feature. Recommended immediate action: fix the two broken endpoints, since users may already be hitting them.
